Android ROM Brainstorm:

Made this to hopefully add some direction!

Any name suggestions? Some ideas I had: *(MemoryOS, DaydreamOS, CandyOS, ReDroid…)*

Custom Android ROM (essentially it's own OS) to recreate classic Android UI but on a functional, everyday ROM.

Blurb:
Do you miss earlier versions of Android? Do you miss when tech felt like it was "made by nerds for nerds". Do you want charm, freedom, and fun on your mobile device?

I'm thinking of starting with a KitKat theme:

- Already have progress
- The UI assets and design guidelines already exist.
- May be more appealing (nostalgia) to new users
- Making a UI from scratch is a whole project in itself
- Me dreaming: If we build up steam, we could always branch out into offering an option for a custom homegrown UI later down the road

The Vibe:

- **KitKat look & feel:** Android ROM that looks and feels true to Android KitKat. If something can't be baked into the ROM, maybe fill the gaps with the launcher, or a skin like OEMs have.

- **New features:** Can throw in some new cool features that are useful/neat but styled so they look like they belong in KitKat

- **Daily driver ready:** So people would want to use it!
    - Maybe give options during setup or diff install versions - with Google Services or without.
    - Options to install with
        - All apps bundled (like simple tools, OSM maps)
        - Select which apps you want

        - No non-essential apps (ultimate customization)

- **“By nerds, for nerds”:** In the old-school days of tech, things had a vibe of being playful, and “made by nerds for nerds.”
    - I think embracing this is what would be appealing and set us apart
    - User niche would most probably be techies/enthusiasts

💡 Wild brainstorms:

- If this turns out to be fun and works well, maybe down the line we tackle the Papercut era (Lollipop/Nougat), and the Pre-modern era (Pie/Android 10) too.
    - That might be popular

Rules that I think are good to stick to so far:

1. **UI** is enjoyable and fun to use, clean and productive
2. **UX** has human design, respects the user, freedom, no bloat, ads, dark patterns
3. **Open Source** so users can read the code running on their devices.

Some Questions:

1. **Target Hardware:** Build for a single device? Which?
2. **Base OS:** Forking LineageOS or clean AOSP? (GrapheneOS sounds cool, but might be way too complicated)

Let me know what you guys think!
