CandyOS 🍭

ROADMAP #1:

Now that I can see the whole UI and we've got a lot figured out, here is another outline of what's next!

It seems like the "skeleton" is pretty set up! Now it's time for fleshing out the apps, adding features, and fine tuning the UX/UI to make this a polished experience.

🖥️Development Side:

- **Supplementary features:** Because the UI is from over 10 years ago, there may be some things that need some updating, or more features. (For example, more options in the calculator app, or whatever else you think is lacking). But actually, a surprising amount of things actually don't need to be changed at all and fit right into 2026!
    - Lex said he's working on an assistant

- **App functionality:** The bones of the Reminders and Notes app are great, but they need to be fleshed out and add features! (Cinement mentioned he is working on the Settings app!)

- **These are just suggestions - I think progress goes best when we just work on what's fun and cool to you!**

🎨Design Side: (I'm planning to get to these)

- **Notes and Reminders** app icons

- **Custom Wallpapers**

"One Bite at a Time" Method:

This is how I work best - I was thinking of focusing on one aspect of the UX/UI at a time, going through and tweaking the UX/UI until it's perfect for use. (For example, one day focus on the status bar, the next day tweak the launcher UI.)

I think the easiest way to do this is if I access the code and could edit it myself in Android Studio. Apparently there is a way to edit the UI in "design mode" in Android Studio, and actually edit the XML code! I would have to try it out in a throwaway environment first while I learn how to use GitHub. Hoping to start this shortly.

Hopefully this way… *You guys can build things → I can work on the UI/UX*

Design + Development Sides:

- We need to **overhaul the Lineage app UIs** to look like KitKat. Unless you think it's fine for them to remain like newer material design.

- **Lock Screen** - UI, functions, features

- **Notifications -** UI, functions, features

- **UI Animations** – Some UI animations could be tweaked, like app opening and closing animation. Apparently it's not possible to tweak these via just Android Studio Mode for System UI. (App UI works though). I think this is something we should look into since animation is a big part of an OS. According to Gemini you could:
    - Design them in Figma first
    - Then define the "motion specs"
        - **Duration (in milliseconds):** e.g., `250ms` for opening, `200ms` for closing.
        - **Easing / Curve:** e.g., *Accelerate/Decelerate*, *Linear*, or a specific cubic-bezier curve like `cubic-bezier(0.4, 0.0, 0.2, 1)`.
        - **Scale & Translation:** e.g., *"Start at 90% scale and fade from 0% to 100% opacity while scaling up to 100%."*
    - Then program it in… - **do you guys have any insights on all this?**

I also made an "idea list" thread in #candy-os that anyone in the discord can add feature ideas to!

Huge shoutout to @LEX and @Cinement for building the technicals, project framework, and making this exist! And thanks to anyone who contributed ideas.
